     Production of wear-resistant boride layers on metallic surfaces comprises
     mixing a boron halide as boron carrier, selected from boron trifluoride,
     boron tribromide and boron triiodide, with hydrogen and optionally argon
     and/or nitrogen to produce a reaction gas containing 1-35 vol.% boron
     halide, and activating the mixture obtained using plasma discharge, so
     that boron transition from the plasma to the metal surface is made
     possible.
          USE - The process is used for boriding iron materials.
